

■ Python `os` Module Cheat Sheet

■ File & Directory Management

Function	Description
<code>os.chdir(path)</code>	Change the current working directory.
<code>os.getcwd()</code>	Get the current working directory.
<code>os.listdir(path='.')</code>	List files and folders in the directory.
<code>os.mkdir(path)</code>	Create a new directory.
<code>os.makedirs(path)</code>	Create intermediate directories if needed.
<code>os.remove(path)</code>	Delete a file.
<code>os.rmdir(path)</code>	Remove an empty directory.
<code>os.removedirs(path)</code>	Remove directories recursively.
<code>os.rename(src, dst)</code>	Rename a file or directory.
<code>os.replace(src, dst)</code>	Rename, replacing destination if it exists.
<code>os.stat(path)</code>	Get metadata of a file or directory.
<code>os.scandir(path='.')</code>	Iterator of directory entries.

■ Path Manipulation

Function	Description
<code>os.path.abspath(path)</code>	Get absolute path.
<code>os.path.basename(path)</code>	Get the final component of a path.
<code>os.path.dirname(path)</code>	Get directory name from a path.
<code>os.path.exists(path)</code>	Check if path exists.
<code>os.path.isfile(path)</code>	Check if it's a file.
<code>os.path.isdir(path)</code>	Check if it's a directory.
<code>os.path.join(path, *paths)</code>	Join path components.
<code>os.path.split(path)</code>	Split into (head, tail).
<code>os.path.splitext(path)</code>	Split into (root, ext).
<code>os.path.getsize(path)</code>	Get file size.
<code>os.path.getmtime(path)</code>	Get last modification time.

■ Environment Variables

Function	Description
<code>os.environ</code>	Environment variables dictionary.

Function	Description
os.getenv(key)	Get environment variable value.
os.putenv(key, value)	Set an environment variable.
os.unsetenv(key)	Remove an environment variable.

■ Process & System Management

Function	Description
os.system(command)	Run a shell command.
os.startfile(path)	Open file with default app (Windows).
os.getpid()	Get process ID.
os.getppid()	Get parent process ID.
os._exit(n)	Exit process immediately.

■ Miscellaneous Functions

Function	Description
os.urandom(n)	Return n random bytes.
os.cpu_count()	Get number of CPUs.
os.name	Name of OS ('posix', 'nt').
os.sep	Path separator ('/' or '\\').
os.linesep	Line separator ('\n', '\r\n').
